FUJIFILM Irvine Scientific has been a well-recognized supplier of innovative media solutions and lab supplies to the ART community for almost 30 years.

Media solutions, such as ISolate for sperm preparation and Freezing Medium TYB for cryopreservation, have set industry standards in the field of andrology. FUJIFILM Irvine Scientific pioneered the use of vitrification to increase survival rates of cryopreserved oocytes and embryos with Vit Kit and Vit Kit-NX.

Today, with a new generation of optimized, multi-use media, Multipurpose Handling Medium and Continuous Single Culture, FUJIFILM Irvine Scientific continues to increase workflow efficiency and contribute to successful pregnancies in clinics throughout the world.

From Gametes to Blastocysts

- Help to improve workflow efficiency and clinical outcomes in a fully integrated workflow
- Reduce stress on the embryo and the embryologist
- Handle gametes and embryos in a stable environment
- Enhance performance with high quality products

Learn about the latest FUJIFILM Irvine Scientific solutions for reproductive technologies in our brochures:

- From gametes to blastocyst
- Vitrification of oocytes and embryos
- Sperm preparation, handling and storage

Reduce Stress
on the embryo and the embryologist

Continuous Single Culture-NX provides an optimal environment for embryo development by eliminating unnecessary stress:

- Keep metabolic rates efficient with reduced lactate concentrations
- Minimize embryo disturbances:
  - No dish changes
  - Reduce pH fluctuations
  - Reduce exposure to varying culture conditions
- Save on laboratory supplies:
  - Reduce media usage—no medium changes
  - Fewer dishes and medium preparation steps

Continuous Single Culture media work effectively in:

- All time-lapse surveillance systems
- Day 5 blastocyst transfer programs with subsequent vitrification of surplus embryos, yielding a high blastocyst utilization rate (BUR)
- Day 3 transfer and vitrifying programs
- Preimplantation Genetic Diagnosis and Screening (PGD/PGS) tests
CSCM-NX is a Clinically-proven, Low-lactate Single-step Medium That Helps Improve Blastocyst Development

In a clinical evaluation of 8,169 embryos, embryos cultured in CSCM-NX had better development than those cultured in CSCM-C.†

<td>48.4% (N=671)</td>
</tr>
</tbody>
</table>

N=Number of embryos
* Differences were significant (p<0.05)

In a retrospective analysis of 6,655 embryos, the mitotic euploidy rates were higher with embryos cultured in CSCM-NX.‡

† Salmon, K. et al. “Improved Embryo development After Use of FUJIFILM Irvine Scientific’s Next Generation Continuous-Culture Media (NXC); ART Reproductive Center, Beverly Hills, CA USA, PCRS 2018
‡ VerMilyea, M.D. et al. “Stress Relief: Can Continuous Culture in a Low-Lactate Culture Medium Reduce Numerical Chromosomal Abnormalities and Therefore Improve Euploidy Rates?”; Ovation Fertility-Austin, Texas. ASRM 2018

With a lower lactate concentration, CSCM-NX improves mitotic euploidy rate by 10% when compared to a sequential culture system and Continuous Single Culture (CSCM).‡
Handle Gametes and Embryos
In a stable environment

The perfect complement to Continuous Single Culture media. Multipurpose Handling Medium provides a versatile solution for all manipulations performed outside of the incubator such as oocyte retrieval and rinsing, sperm processing, ICSI and embryo transfer.

- Ensure an optimal, consistent environment outside the incubator
- Safely handle oocytes, sperm and embryos
  - Maintains physiological pH 7.2–7.4 and osmolality over a broad temperature range
  - Supports maintenance of cellular homeostasis with help of key amino acids, glycine and taurine
  - Reduces risk of toxicity using a dual buffer system (HEPES and MOPS)
- Use alternative protein supplements if preferred

pH Maintained Across Broad Temperature Range

</table>

Martyn Blayney, Head of Science, Bourn Hall Clinic, U.K.
Using genetic engineering to deliver high quality products

Every lot of raw materials used for manufacturing protein and oil is quality control tested using MEGA, a genetic mouse embryo assay that is more sensitive to embryo-toxic materials than the traditional mouse embryo assay (MEA).¹

## Ordering Information

### Culture media
